

Lineage dominance reproduces in spatial data, on the one regulon the panel can measure

GeoMx DSP, two cohorts, 295 ROIs. A targeted ~1,800-gene panel measures only 56 of 500 MYC regulon members and fewer for MYCN and MYCL1, which are not scoreable at all. Within that limit, the M6/M7 result holds in tissue with different chemistry and normalisation.

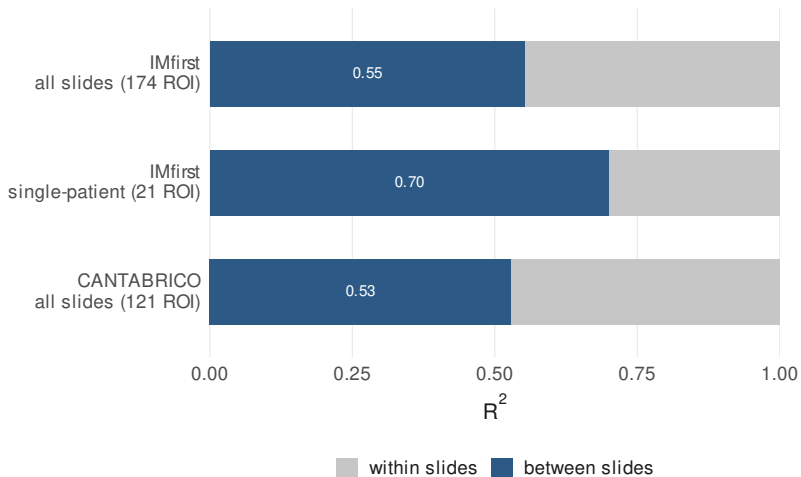

A · Only the MYC regulon is measurable

fraction of regulon members on the CTA panel;
outlined bar passes the gate

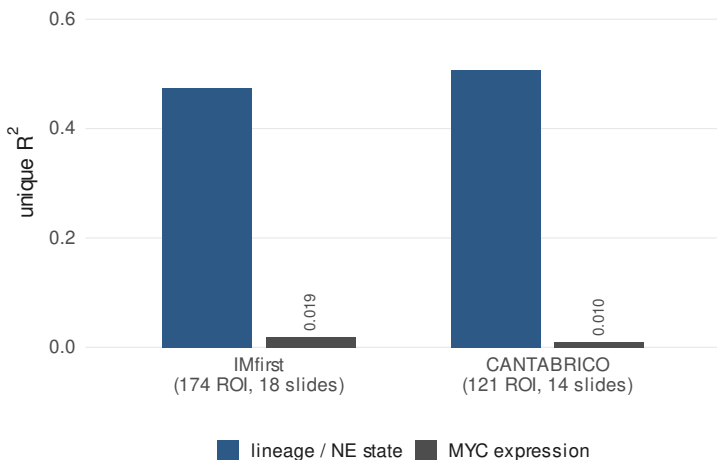

B · A third of the score varies within one tumour

variance in MYC regulon score, partitioned by slide

C · Lineage explains the score here too

unique variance explained, after removing the other term

D · The association does not survive adjustment

Spearman rho, MYC regulon score vs MYC expression
